INDEX

Adult sanctions, 77, 82
  incapacitation effects of, 102
Affordable Care Act, 284
Age-based law enforcement discretion, 95–96
Age distribution of crime, 139
Area Median Gross Income (AMGI), 400–401
As-if random assignment, 13, 157, 161
Assignment variable, measurement error in
  baseline statistical model, 459–463
  continuous assignment variable and measurement error, 484
    estimation, 490–492
    imperfect compliance identification, 489–490
    perfect compliance identification, 484–489
  discrete assignment variable and measurement error, 463
    assignment variable distribution and RD treatment effect, 473–474
    conditional expectation functions and RD treatment effect, 472–473
    potential issues in practical implementation, 476–477
    simple numerical example, 477–484
    true assignment variable distribution, 464
  Medicaid takeup and crowdout, 492–495
  with regression discontinuity design, 456
Asymptotic mean-squared error (AMSE), 360, 369, 423, 437
Availability of RD design, 2
Average treatment effect (ATE), 3, 6, 10, 15, 16, 23, 55–57, 154, 197, 200, 211, 239, 285, 334, 335, 345, 386, 426, 440, 441

BadgerCare, 151
BadgerCare Plus (BC+) program, 151–152, 177
Bajari, Hong, Park, and Town's model, 49–54
Bandwidth, 7, 18, 91, 156, 286, 346–347, 359, 366, 369, 384–385
  and kernel, 429
  selection, 156
"Baseline arrest", 83–85, 90, 92
Baseline statistical model, 459–463
Becker's model of crime, 103–104
Bellman equation, 104

Benchmark Plan, 151
Benefit elasticity, estimates of, 362, 375
Bias correction, 343, 359, 424, 438
  bootstrap, 430–435, 439
Bias estimation, 430
Bootstrap bias correction, 430–435
Bootstrap confidence intervals for sharp RD designs, 421
  application, 440–442
  background, 425–430
  bootstrap bias correction, 430–435
  simulation evidence, 436–440

California's three-strikes law, 75, 78–79
CCF (Calonico, Cattaneo, and Farrell), 384, 387, 388, 390, 393, 394, 410
CCFT (Calonico, Cattaneo, Farrell, and Titiunik), 343, 346, 347, 361
CCT (Calonico, Cattaneo, and Titiunik), 343, 345, 346, 347, 384, 389, 391, 393, 423, 424, 425, 428, 430, 438, 449, 453
Child Development Study (CDS), 457
Children's Health Insurance Program (CHIP), 150, 457
  copayments in, 150–152
CJLPM (Card, Johnston, et al.), 374–375
CLPW (Card, Lee, Pei, and Weber), 343–346, 378n2, 378n3
Clustered data, RD designs with, 383
  application, 399–406
  distributional approximation, 393–394
  extensions, 394–395
  main results, 388
    clustering at running variable level, 390–393
  setup and notation, 385–388
  simulations, 395–399
Cluster-robust bandwidth, 385, 394, 396, 404, 405
"Cluster-robust" standard error formulas, 384, 402
Comparative regression discontinuity (CRD) design, 240
  CRD-CG design, 265
    estimated bias, 266–268
    RCT results, 265–266
    statistical efficiency, 268–269
    support for functional form assumptions, 266
  CRD-pre design, 258–260
    estimated bias, 262–263
    results for, 258–260
    statistical efficiency, 263–264
    support for functional form assumptions, 260–262, 266
  data and analysis methods, 250
    causal estimates for CRD and basic RD designs, 256–257
    causal estimates for RCT design, 254–256
    checking parallel assumptions of CRD, 253–254
    comparing efficiency across designs, 258

creating basic RD, CRD-pre and CRD-CG designs, 251–253
study data, 250–251
designs and within-study comparison approach, 241
gains statistical power from CRD, 248
identification of causal effects using, 244–247
implementation and estimation, 247
sensitivity test, 269–271
testing CRD using a within-study comparison approach, 248
Complier probability derivative (CPD), 319, 322, 333
fuzzy design treatment effect derivative (TED) and, 323–324
Compound treatments, 161–163, 220–221
Computerized Criminal History (CCH) system, 128
Conditional cash transfers (CCTs), 198–200
Conditional geographic mean independence, 160–161, 207
Confidence intervals (CIs), 25, 112, 273–274, 359, 361, 366, 394, 423
Continuity-based RD design, 3, 6, 7, 10, 16
and local randomization, 8–11
Continuous assignment variable and measurement error, 484
estimation, 490–492
imperfect compliance identification, 489–490
perfect compliance identification, 484–489
Conventional (naive) CIs, 427, 439
Copayments in CHIP, 150–152
County-level tax rates, 194
Covariate balance near municipal borders, 203–206
Covariate index, 353–354
Covariates, 4, 163, 170–172, 334, 369–374
Coverage error (CE), 346, 395, 396
Crime control policies, 77
Cumulative distribution function (CDF), 32, 42, 53, 62, 104
Current Population Survey (CPS), 62

Data-dependent estimation approaches, 347
Data-generating processes (DGPs), 343, 366, 395, 424, 427, 432, 436, 437
Density-based identification, 32, 55
Density discontinuity approach, 29, 33, 55–58
Bajari, Hong, Park, and Town's model, 49
identification, 52–54
model, 49–52
Doyle's model, 38
identification, 41–43
inference on the discontinuity in density, 58–64
Jales' model, 43–48
identification, 48–49
Kleven and Waseem's model, 34
economic model, 34–35

identification, 36–38
statistical model, 35–36
minimum wage, 38
Density test, 282, 309
Deterrence, defined, 117
Deterrence effect of prison, 73
arrest-level database, 128
construction of data set, 128
date variables, 128–129
arrest probabilities, 134–140
average incarceration lengths, 129–133
data and sample, 82
main analysis sample, 83–86
measurement and reporting discontinuities, 86–87
evidence on deterrence and incapacitation, 87
age-based law enforcement discretion, 95–96
evidence on deterrence, 87–92
evidence on incapacitation, 101–103
expungement of juvenile records, 96–101
transfers of juveniles to the adult criminal court, 92–95
existing literature, 77–80
identification and estimation, 80–82
predicted effects from dynamic model of crime, 103
benchmark model calibration and predicted values for θ, 106–110
connecting θ to broader policy elasticities, 111–112
model, 103–106
nonparametric bounds on policy elasticities, 112–114
Differences-in-differences (DID), 152, 179
Discontinuous assignment of treatment at geographic boundary, 152
in the absence of geo-located individual data, 156–157
geo-location of few coarse geographic units, 158–161
geo-location of small aggregate units, 157–158
GRD designs when data is geo-located, 153–156
Discrete assignment variable and measurement error, 463
assignment variable distribution and RD treatment effect, 473–474
conditional expectation functions and RD treatment effect, 472–473
potential issues in practical implementation, 476–477
simple numerical example, 477–484
true assignment variable distribution, 464
imperfect compliance, 468–472
perfect compliance, 464–468
Discrete test for running variable manipulation, 286–289
additional support points, 291
choosing k, 291–292
critical values, 289–291
null distribution, 289–291

power, 289–291
test statistic, 289–291
Distributional approximation, 385, 393–394
Double-dose algebra, 8, 14, 23
"Doughnut hole" design, 166
Doyle's model, 38–43
extensive–margin response and imperfect compliance, 41
identification, 41–43
Dual-economy setting, 44
Dynamic model of crime, predicted effects from, 103
benchmark model calibration and predicted values for θ, 106–110
connecting θ to broader policy elasticities, 111–112
model, 103–106
nonparametric bounds on policy elasticities, 112–114

Econometric framework, 284
discrete test for running variable manipulation, 286–289
standard tests for running variable manipulation, 285–286
Effect structure assumption, 33, 54, 58, 64, 65
Elasticity, 38, 65, 112–114, 115, 142, 144
intertemporal, 146
Employment effects, 31, 38, 41, 42, 43, 49
"Excess of mass", concept of, 43
Exclusion restriction, 5, 11, 15–16, 18
local independence and, 19–21
Experimental analysis under local independence, 22–24
Experimental samples used to assess validity, 211–213
External validity, 210–213, 216–219, 222, 318–319, 320, 325, 337

Falsification test, 163, 165, 167, 168, 171–175, 247, 320
Family and Medical Leave Act, 284
FG (Fan and Gijbels), 343, 347, 355, 359–361
"First arrest", 83, 101, 103, 107
Fisherian randomization-based approach, 5, 15–16
Fixed-*G* calculations, 384, 388, 411
Florida Department of Law Enforcement (FDLE), 83, 95, 122, 128
Forcing variable, 30–32, 55, 57, 58, 318
imperfect control of, 31
Fuzzy design treatment effect derivative (TED) and complier probability derivative (CPD), 322–324
"Fuzzy" generalization of the sharp design, 345
Fuzzy RD design, 25n3, 322, 323, 329, 337, 395
Fuzzy RKD estimates, 346, 360–361

Geographically discontinuous treatment assignments, 147, 152
in the absence of geo-located individual data, 156–157

application, 168
analysis plan, 171–172
balance results and placebo tests, 175–179
data, 168–171
falsification test, 172–175
outcome estimates, 179–180
county level tax rates, 194
discussion, 180–182
empirical application, 150–152
geo-location of few coarse geographic units, 158–161
geo-location of small aggregate units, 157–158
GRD designs when data is geo-located, 153–156
particularities of, 161
compound treatments, 161–163
interference, 165–166
and internal validity, 163–165
local nature of effects, 166–167
spatial treatment effects, 167–168
placebo tests, 191
Geographic discontinuity design (GDD), 196
Geographic quasi experiment (GQE), 161, 164, 175, 197, 201
compound treatment irrelevance, 220–221
covariate balance near municipal borders, 203–206
estimates, 209–210
experimental samples used to assess validity, 211–213
external validity, 210–211, 216–219
internal validity, 210–211, 219–220
inverse-probability weighting and external validity, 213–215
potential threats to internal validity, 207–208
sample, 201–203
Geographic regression discontinuity (GRD), 150
GRD designs when data is geo-located, 153–156
Growth in RD empirical applications, 2

Head Start application, 274, 440
Head Start program, 437, 440–442
Health care utilization, 152, 154, 162, 165, 168, 170, 177–181, 457
trends in (2007–2008), 189–190
Heteroskedasticity-robust standard errors, 394, 402
Hypothesis tests, 423, 428
Hypothetical experiment, 4

Identification strategy, 40, 75, 78, 80–82, 175
IK (Imbens and Kalyanaraman), 384, 391
Incapacitation
defined, 117
effect, 76–77, 79, 82
evidence on, 101–103
Index crimes, 84, 86, 133
Informal sectors, 43–44, 49
Informational constraints, in medical industry, 49–54

Instrumental variables (IVs) designs, 3
Insurance copays, 152–153
Internal validity, 163–164, 210–211, 219–220
  potential threats to, 207–208
Interpretation of RD designs, 2–5, 25, 157
Intertemporal elasticity, 2–5, 146
Inverse-probability weighting and external validity, 213–215
Iterated bootstrap, 424, 430, 434, 435, 452

Jales' model, 43–49
  identification, 48–49
  missing and excess of mass, 47
Juvenile Justice Reform Act (JJRA) (1994), 86–87, 95, 140
Juvenile records, 85, 95
  expungement of, 96–101
Juveniles
  crime rates, 78
  justice system, 78
  transfers of, to adult criminal court, 92–95

Kernel, bandwidth and, 429
Kernel function, 61
Kleven and Waseem's model, 34, 65
  bunching at tax notch, 36
  economic model, 34–35
  identification, 36–38
  statistical model, 35–36

Labor costs, 65
Labor unions, 282
Latent wage, 38, 40
Lee's framework, 4
Leibniz integral rule, 141
Local average response (LAR), 345
Local average treatment effect (LATE), 239, 318, 320, 326, 327
Local experiments, interpretation of RD designs as, 4–5, 10–11
Local independence, 18
  and exclusion restriction, 19–21
  experimental analysis under, 22–24
  random assignment of score and, 18–19
Local likelihood approach, 63
Local polynomial estimators, 384, 406, 416
Local randomization RD framework, 6, 10, 11
  formalizing, 15–18
  of score/treatment, 11–12
  score value, 12–15
Low-Income Housing Tax Credits (LIHTC), 385, 399, 402
  and neighborhood characteristics, 399–406

Manipulation test, 58–59, 304
Maximum likelihood estimation (MLE) framework, 458
McCrary test with discrete data, 292–293
McCrary's binning-based local linear approach, 63
Mean-squared errors (MSE), 343, 347
  MSE minimization, 156
  MSE-optimal bandwidth, 384, 411, 416
  MSE-optimal procedure, 361

Measurement error in assignment variable
  baseline statistical model, 459–463
  continuous assignment variable and measurement error, 484
    estimation, 490–492
    imperfect compliance identification, 489–490
    perfect compliance identification, 484–489
  discrete assignment variable and measurement error, 463
    assignment variable distribution and RD treatment effect, 473–474
    conditional expectation functions and RD treatment effect, 472–473
    potential issues in practical implementation, 476–477
    simple numerical example, 477–484
    true assignment variable distribution, 464
  Medicaid takeup and crowdout, 492–495
  with regression discontinuity design, 456
Medicaid, 458–459, 492–495
Medicaid Analytics Extracts, 170
Medicaid takeup and crowdout, 492–495
Medical Expenditure Panel Survey (MEPS), 457
Minimum wage policy, 32, 38, 43–45
Missing mass, 33, 36, 38, 42–43, 68
"Missing workers", concept of, 38
Modifiable areal unit problem (MAUP), 158
Moment generating functions (MGFs), 466
Monte Carlo simulations, 61, 309, 343, 364–365, 367–368
MTTE, treatment effect derivative (TED) and, 335–336

Naïve RD interval, 423
National Labor Relations Board (NLRB), 283
Neyman–Rubin framework, 2, 3
Non-Index crimes, 96
Notches, 34–35
Null distribution, 289–291

Observed information matrix (OIM), 119
Optimal bandwidth, 416
Optimal bandwidth selectors, 384–385, 406
Outer product of the gradient (OPG), 119

Panel Study of Income Dynamics (PSID), 457
"Pass/fail" threshold, 30
Policing elasticity, 142
Policy reforms, types of, 76
Political parties, 282
Popularity of RD design, 2
Potential outcomes regression functions, 8, 10
"Pre-asymptotic" cluster-robust standard errors, 394
Preventive health visits, 151
Probability of disemployment, 32

"Proof of concept", 424
Punitive criminal justice sanctions, 75, 77

Qualified Census Tract (QCT), 399, 400, 401, 402, 405
"Quasi-experimental" research designs, 3

Random assignment of score and local independence, 18–19
Randomization, 5, 6, 11, 17
Randomized controlled trial (RCT), 239
  causal estimates for RCT design, 254–256
Rdrobust software, 91, 156
Regression functions, 6, 8, 13, 19, 20, 24, 154, 255, 386
Regression kink design (RKD), 319, 341, 342
  data and analysis sample, 349–350
  estimation and inference, review of, 345–347
  estimation results, 355
    alternative estimators, comparison of, 361–369
    comparison with Missouri RKD application in card, 374–375
    covariates, estimates with, 369–374
    fuzzy RKD estimates, 360–361
    reduced form kinks in treatment and outcome variables, 355–360
  graphical overview of the effect of kinks in the UI benefit schedule, 350–355
  identification, review of, 344–345
  unemployment insurance (UI) benefit schedule in Austria, 348–349
Reimbursement schemes, 49–54
Relative punitiveness, 78, 117
Root-mean-squared error (RMSE), 363, 366, 380n20
Running variable, 2–3, 5, 13, 19, 21, 23, 57, 80, 82, 149–150, 154–155, 157–158, 282–288, 291–301, 303, 304, 309, 315, 319, 321, 329, 335, 371, 384–388, 390, 392, 396–399

"Second arrest", 83, 101, 107
Sector-specific density of wages, 46
Selection-on-observables assumption, 3, 164, 211
Sharp design, "fuzzy" generalization of, 345
Sharp design treatment effect derivative (TED), 321–322
Sharp RD designs, bootstrap confidence intervals for. *See* Bootstrap confidence intervals for sharp RD designs
"Sharp" RKD, 344
Simulation evidence, 436–440
Simulation extrapolation (SIMEX) method, 458, 489–490, 492, 496, 498

Small aggregate units, geo-location of, 157–158
Smoothness-based RD methods, 155
Stable unit treatment value assumption (SUTVA), 153, 165, 320, 336
Standard Plan, 151
Standard tests for running variable manipulation, 285–286
Survey of Income and Program Participation (SIPP), 458

Tax system, 34, 35, 65
Taylor expansion, 37, 412, 424
Testing stability of regression discontinuity models, 317
  covariates, 334
  empirical examples, 325–334
  fuzzy design treatment effect derivative (TED) and complier probability derivative (CPD), 322–324
  literature review, 320–321
  sharp design treatment effect derivative (TED), 321–322
  stability, 324–325
  treatment effect derivative (TED) and MTTE, 335–336
Test statistic, 61, 63, 284, 287, 289–291
Threshold, 31–34, 49, 318–320, 326, 327, 329, 330, 331, 333, 335–336, 337
Treatment effect derivative (TED), 318–319, 324
  fuzzy design TED and complier probability derivative (CPD), 322–324
  and MTTE, 335–336
  sharp design, 321–322
Treatment effect ratio, 57–58
Treatment-on-the-treated (TOT), 239, 241, 244, 249, 255, 257, 345
Triangular kernel function, 61
Two-stage least squares (2SLS), 331

Unemployment insurance (UI) benefit schedule in Austria, 348–349
  graphical overview of the effect of kinks in, 350–355
Unemployment Insurance (UI) records, 329

Variance components, 450
"Victimless" offenses, 96

Weibull models, 121
Wild bootstrap, 424, 430, 433, 437, 438
Wisconsin CHIP program, 151, 152
Wisconsin–Illinois border, 159, 163, 167–168
  housing prices at, 172
Wisconsin–Illinois boundary, 154
