Solvability of nonlinear fractional integro-differential equation with nonlocal condition

Sakhri Aicha and Ahcene Merad
Department of Mathematics and Computer Sciences, Larbi Ben Mhidi University, Oum El Bouaghi, Algeria

Abstract
Purpose – This study describes the applicability of the a priori estimate method on a nonlocal nonlinear fractional differential equation for which the weak solution's existence and uniqueness are proved. The authors divide the proof into two sections for the linear associated problem; the authors derive the a priori bound and demonstrate the operator range density that is generated. The authors solve the nonlinear problem by introducing an iterative process depending on the preceding results.

Design/methodology/approach – The functional analysis method is the a priori estimate method or energy inequality method.

Findings – The results show the efficiency of a priori estimate method in the case of time-fractional order differential equations with nonlocal conditions. Our results also illustrate the existence and uniqueness of the continuous dependence of solutions on fractional order differential equations with nonlocal conditions.

Research limitations/implications – The authors' work can be considered a contribution to the development of the functional analysis method that is used to prove well-positioned problems with fractional order.

Originality/value – The authors confirm that this work is original and has not been published elsewhere, nor is it currently under consideration for publication elsewhere.

Keywords Existence and uniqueness, A priori estimate, Fractional derivatives and integrals, Integral condition

Paper type Research paper

1. Introduction
Fractional order partial differential equations have become one of the most popular areas of research in mathematical analysis. Their application has been utilized in various scientific fields, such as optimal control theory, chemistry, physics, mathematics, biology, finance and engineering [1–5].

Integro-differential equations are a combination of derivatives and integrals which are appealing to both researchers and scientists for their applications in many areas [6–9]. Numerous mathematical formulations of physical phenomena include integro-differential equations, which may arise in modelling biological fluid dynamics [10–15].

It is important to establish effective methods to solve fractional differential equations (FDEs). Recently, a great deal of attention was dedicated to FDE solutions utilizing different methods, including the Adomian decomposition method [16,17], the Laplace transform...
method [18], exponential differential operators [19], the F-expansion method [20], non-Nehari manifold method [21] and the reproducing kernel space method [22,23], in the search for exact or analytical solutions. The applicability of most techniques becomes difficult with the presence of the integral condition. The energy inequality method is a useful tool for studying nonlocal fractional and classical problems. Compared with other techniques, it has an essential role in establishing the solution’s existence and uniqueness proof and depends on density arguments and certain \textit{a priori} bounds.

There have been few articles related to nonlinear fractional partial equations that employ the energy inequality method [24]. Furthermore, for partial differential equations with classical order, many results have utilized this method [25–28]. Motivated by the previous results, the authors studied a nonlocal nonlinear time-fractional order problem. Moreover, we demonstrate the solution’s uniqueness, existence and dependence on the given data.

This article is outlined in the following way: in Section 2, we present the main problem. The next section is focused on posing the associated linear problem and introducing some required preliminaries and functional spaces. Then, in Section 4, we develop the energy inequality method to demonstrate the linear problem’s strong solution’s uniqueness. In addition, we prove the strong solution’s existence in Section 5. Moreover, we derive \textit{a priori} bound and demonstrate the generated operator range density in a Hilbert space. We solve the nonlinear problem in Section 6 by utilizing the results achieved in Sections 4 and 5, and an iteration process.

2. Statement of problem

In the region $D = \Omega \times [0, T]$, $\Omega = (0, 1)$, $T < \infty$, we pose the nonlinear fractional equation

$$L v = c \partial_{t}^{\beta+1} v - \frac{\partial}{\partial x} \left( \gamma(x, t) \frac{\partial v}{\partial x} \right) - \frac{\partial}{\partial x} \left( \eta(x, t) \frac{\partial v}{\partial x} \right) - \int_{0}^{t} \xi(t-s) v(x, z) dz$$

$$= f(x, t, v, \frac{\partial v}{\partial x}) \tag{1}$$

with $0 < \beta < 1$.

Associated with initial condition

$$\ell_{1} v = v(x, 0) = \varphi(x), \quad \ell_{2} v = \frac{\partial v(x, 0)}{\partial t} = \psi(x), \quad x \in \Omega, \tag{2}$$

and the boundary condition

$$\int_{0}^{1} v(x, t) dx = 0, \quad v_{x}(1, t) = 0, \quad t \in (0, T), \tag{3}$$

Such that the known functions $\gamma, \eta$ and $\xi$ verify Assumption 1, and data functions $f, \varphi$ and $\psi$ belong to suitable function spaces as mentioned in Section 3.

In the Caputo definition for a function $v$, the fractional derivatives of order $\beta + 1$ with $0 < \beta < 1$ is defined as

$$c \partial_{t}^{\beta+1} v(x, t) = \frac{1}{\Gamma(1-\beta)} \int_{0}^{1} t(t-\tau)^{\beta} d\tau,$$  

where $\Gamma(.)$ is the gamma function
and the Riemann-Liouville integral of order $0 < \beta < 1$, which is given by
\[
D_t^\beta v(x, t) = \frac{1}{\Gamma(\beta)} \int_0^1 \frac{v(x, \tau)}{(t - \tau)^{1-\beta}} d\tau.
\] (5)

3. Technical tools and associated linear problem

We define some function spaces and tools required to investigate the following linear problem associated with problems (1)–(3).

\[
L v = c \partial_t^{\beta+1} v - \frac{\partial}{\partial x} \left( \gamma(x, t) \frac{\partial v}{\partial x} \right) - \frac{\partial^2}{\partial x \partial t} \left( \eta(x, t) \frac{\partial v}{\partial x} \right) - \int_0^t \xi(t - z) v(x, z) dz = f(x, t)
\] (6)

where the unbounded operator $L = (L, \ell_1, \ell_2)$ with $L: E \to F$ is defined in $D(L)$ such that
\[
D(L) = \left\{ v \in L^2(D), \partial_t^{\beta+1} v, \frac{\partial v}{\partial t}, \frac{\partial v}{\partial x}, \frac{\partial^2 v}{\partial x^2}, \frac{\partial^3 v}{\partial x^2 \partial t} \in L^2(D) \right\}
\] (10)

and $v$ also verify the initial condition. Here $E$ is Banach space containing elements having the finite norm
\[
\| v \|^2_E = D_t^{\beta+1} \left\| \frac{\partial v}{\partial t} \right\|^2_{L^2(\Omega)} + \left\| \frac{\partial v}{\partial x} \right\|^2_{L^2(\Omega)} + \left\| v \right\|^2_{C([0, T], L^2(\Omega))},
\] (11)

and $F$ is Hilbert space composed of functions normed with
\[
\| F \|^2_F = \left\| \mathcal{S} f \right\|^2_{L^2(D)} + \left\| \varphi \right\|^2_{L^2(\Omega)} + \left\| \mathcal{S} \psi \right\|^2_{L^2(\Omega)}.
\] (12)

Lemma 1. [29] Let $S(t)$ a nonnegative absolute continuous function verifying the inequality
\[
c c_t^\alpha S(t) \leq c_1 S(t) + c_2(t), \quad 0 < c < 1,
\] (13)

for almost all $t \in [0, T]$, where $c_1$ is a positive constant and $c_2(t)$ is an integrable nonnegative function on $[0, T]$. Then,
\[
S(t) \leq S(0) E_{\alpha}(c_1 t^\alpha) + \Gamma(\alpha) E_{\alpha, \alpha}(c_1 t^\alpha) D_t^{-\alpha} c_2(t),
\] (14)

where
\[
E_{\alpha}(x) = \sum_{n=0}^{\infty} \frac{x^n}{\Gamma(an + 1)} \quad \text{and} \quad E_{\alpha, \nu}(x) = \sum_{n=0}^{\infty} \frac{x^n}{\Gamma(an + \nu)},
\]

are Mittag-Leffler functions.
Lemma 2. [29] On the interval \([0, T]\), any absolute continuous function \(y(t)\) verifies the following estimate:

\[
S(t)C_\beta S(t) \geq \frac{1}{2} \int_0^t S^2(t), \quad 0 < \beta < 1,
\]

Lemma 3. [30] For any \(n \in \mathbb{N}\), we have

\[
\| \mathcal{A}_x^{2n} v \|^2_{L^2(0,T)} \leq \left( \frac{l}{2} \right)^{2n} \| v \|^2_{L^2(0,T)},
\]

where

\[
\mathcal{A}_x^{2n} v = \int_0^x \int_0^{\xi_1} \ldots \int_0^{\xi_{2n-1}} v(\eta, t) d\eta d\xi_{2n-1} \ldots d\xi_1 = \int_0^x (x - \xi)^{2n-1} (2n - 1)! v(\xi, t) d\xi.
\]

Cauchy \(\varepsilon\)-inequality [31]

\[
| ab | \leq \frac{\varepsilon}{2} a^2 + \frac{1}{2\varepsilon} b^2,
\]

which holds for arbitrary \(a\) and \(b\), and all \(\varepsilon > 0\).

4. \textit{A priori} estimate and consequences

Assumption 1. For any \((x, t) \in D\), we suppose that

\[
c_0 \leq \gamma(x, t) \leq c_1, \quad \frac{\partial \gamma(x, t)}{\partial t} \leq c_2, \quad \frac{\partial \gamma(x, t)}{\partial x} \leq c_3
\]

\[
c_4 \leq \eta(x, t) \leq c_5, \quad \frac{\partial \eta(x, t)}{\partial t} \leq c_6, \quad \frac{\partial \eta(x, t)}{\partial x} \leq c_7
\]

\[
\frac{\partial^2 \eta(x, t)}{\partial t^2} \leq c_8, \quad \frac{\partial^2 \eta(x, t)}{\partial t \partial x} \leq c_9, \quad \eta(x, t) \leq c_{10}
\]

such that \(c_i (i = 0, \ldots, 10)\) are positive constants.

Theorem 4. Let Assumption 1 be fulfilled. Then, any function \(v \in D(L)\) verify the following estimate

\[
\| v \|_E \leq C \| Lv \|_F.
\]

where \(C > 0\) constant independent of \(v\).

Proof. We take the scalar product \(L^2(D^r)\) of equality (6) and the integro-differential operator \(Mv = -2\mathcal{A}_x^{2n}v\), such that \(r \in [0, T]\), we have
By applying inequality (16), we estimate the first and the last two terms on the right-hand side (RHS) of Equation (24); as such it follows that

\[ -2 \left( \frac{\partial^2}{\partial t^2} \eta(x,t) \right) \leq \int_{D'} \left( \nabla \cdot \left( \eta(x,t) \frac{\partial v}{\partial t} \right) \right)^2 dx dt + \int_{D'} \left( \eta \frac{\partial^2}{\partial t^2} \frac{\partial v}{\partial t} \right)^2 dx dt, \]

(25)
\[
2 \int_{\mathcal{D}^r} \left( \int_0^t \xi(t-z) v(x,z) dz \right) \mathcal{Z}_x \frac{\partial v}{\partial t} dx dt \leq c_{10} T^2 \| v \|_{L^2(\mathcal{D}^r)}^2 + \frac{1}{2} \int_{\mathcal{D}^r} \left( \mathcal{Z}_x \frac{\partial v}{\partial t} \right)^2 dx dt \quad (26)
\]

Solvability of nonlinear fractional equation

\[
-2 \int_{\mathcal{D}^r} \left( \frac{\partial \eta}{\partial x} + \frac{\partial^2 \eta}{\partial x \partial t} \right) v \mathcal{Z}_x \frac{\partial v}{\partial t} dx dt \leq 2 \int_{\mathcal{D}^r} \left\{ \left( \frac{\partial \eta}{\partial x} \right)^2 + \left( \frac{\partial^2 \eta}{\partial x \partial t} \right)^2 \right\} v^2 dx dt + \int_{\mathcal{D}^r} \left( \mathcal{Z}_x \frac{\partial v}{\partial t} \right)^2 dx dt. \quad (27)
\]

By Lemma 2, the first term on the LHS of (20) becomes

\[
2 \left( c \partial_t^\beta \left( \mathcal{Z}_x \frac{\partial v}{\partial t} \right), \mathcal{Z}_x \frac{\partial v}{\partial t} \right)_{L^2(\mathcal{D}^r)} \geq \int_{\mathcal{D}^r} c \partial_t^\beta \left( \mathcal{Z}_x \frac{\partial v}{\partial t} \right)^2 dx dt, \quad (29)
\]

Hence, by Formulas (25)–(29) and Assumption (1), we obtain

\[
\int_{\mathcal{D}^r} \left( c \partial_t^\beta \left( \mathcal{Z}_x \frac{\partial v}{\partial t} \right)^2 \right) dx dt + \int_0^t \| \frac{\partial v}{\partial t}(.,t) \|^2_{L^2(\Omega)} dt + \| v(.,1) \|^2_{L^2(\Omega)} \leq \delta_1 \left\{ \int_0^t \| \mathcal{Z}_x f(.,t) \|^2_{L^2(\Omega)} dt + \| \varphi \|^2_{L^2(\Omega)} + \int_0^t \| \mathcal{Z}_x \frac{\partial v}{\partial t}(.,t) \|^2_{L^2(\Omega)} dt \right\} + \delta_2 \left\{ \int_0^t \| v(.,t) \|^2_{L^2(\Omega)} dt \right\},
\]

where

\[
\delta_1 = \frac{\max\left( 1, c_1 + c_6, \frac{5}{2} + \frac{2}{c_1} \right)}{\min(c_4, c_0 + c_5, 1)},
\]

\[
\delta_2 = \frac{c_2 + c_8 + c_3^2 + c_9^2 + c_{10} T^2}{\min(c_4, c_6 + c_5, 1)}.
\]

Now, since

\[
\int_0^t c \partial_t^\beta \| \mathcal{Z}_x \frac{\partial v}{\partial t} \|^2_{L^2(\Omega)} dt = D_{\tau}^{-1} \| \mathcal{Z}_x \frac{\partial v}{\partial t} \|^2_{L^2(\Omega)} \leq \frac{\tau^{1-\beta}}{(1-\beta) \Gamma(1-\beta)} \| \mathcal{Z}_x \psi \|^2_{L^2(\Omega)}, \quad (30)
\]

then

\[
D_{\tau}^{-1} \| \mathcal{Z}_x \frac{\partial v}{\partial t} \|^2_{L^2(\Omega)} + \int_0^t \| \frac{\partial v}{\partial t}(.,t) \|^2_{L^2(\Omega)} dt + \| v(.,1) \|^2_{L^2(\Omega)} \leq \delta_3 \left\{ \int_0^t \| \mathcal{Z}_x f(.,t) \|^2_{L^2(\Omega)} dt + \| \varphi \|^2_{L^2(\Omega)} + \| \mathcal{Z}_x \psi \|^2_{L^2(\Omega)} + \int_0^t \| \mathcal{Z}_x \frac{\partial v}{\partial t}(.,t) \|^2_{L^2(\Omega)} dt \right\} + \delta_2 \left\{ \int_0^t \| v(.,t) \|^2_{L^2(\Omega)} dt \right\}, \quad (31)
\]
where
\[ \delta_3 = \max\left(\delta_1, \frac{T^{1-\beta}}{(1 - \beta)\Gamma(1 - \beta)}\right), \]

We need to drop the last term on the RHS of (31). Therefore, we use Gronwall’s lemma, which yields
\[ D_t^{\beta-1} \| \mathcal{S}_x \frac{\partial v}{\partial t} \|_{L^2(\Omega)}^2 + \int_0^t \| \frac{\partial v}{\partial t}(\cdot,t) \|_{L^2(\Omega)}^2 dt + \| v(\cdot, \tau) \|_{L^2(\Omega)}^2 \leq \delta_3 \left\{ \int_0^t \| \mathcal{S}_x \frac{\partial v}{\partial t}(\cdot,t) \|_{L^2(\Omega)}^2 dt \right\}, \]

where
\[ \delta_4 = \exp(\delta_2 T)\delta_3, \]

Now, by discarding the last two terms on the LHS of (32) then posing \( S(\tau) = \int_0^\tau \| \mathcal{S}_x \frac{\partial v}{\partial t}(\cdot,t) \|_{L^2(\Omega)}^2 dt \), \( \mathcal{S}_t^{\beta-1} S(\tau) = D_t^{\beta-1} \| \mathcal{S}_x \frac{\partial v}{\partial t} \|_{L^2(\Omega)}^2 \) with \( S(0) = 0 \), in Lemma (1), we obtain
\[ \delta_5 = \Gamma(\beta)E_{\beta, \beta}(c_{17} T^\beta) \max\left(1, \frac{T^{(\beta+1)}}{(1 + \beta)\Gamma(1 + \beta)}\right), \]

Combining (32)–(33) yields
\[ D_t^{\beta-1} \| \mathcal{S}_x \frac{\partial v}{\partial t} \|_{L^2(\Omega)}^2 + \int_0^t \| \frac{\partial v}{\partial t}(\cdot,t) \|_{L^2(\Omega)}^2 dt + \| v(\cdot, \tau) \|_{L^2(\Omega)}^2 \leq \delta_6 \left\{ D_t^{\beta-1} \| \mathcal{S}_x f \|_{L^2(\Omega)}^2 + \| \mathcal{S}_x \psi \|_{L^2(\Omega)}^2 \right\}, \]

where
\[ \delta_6 = \max(\delta_4, \delta_5), \]

From given inequality
\[ D_t^{1-\beta} \| \mathcal{S}_x f \|_{L^2(\Omega)}^2 \leq \frac{T^\beta}{\Gamma(1 + \beta)} \int_0^T \| \mathcal{S}_x f \|_{L^2(\Omega)}^2 dt, \]

we reduce inequality (34) as follows
\[ D_t^{\beta-1} \| \mathcal{S}_x \frac{\partial v}{\partial t} \|_{L^2(\Omega)}^2 + \int_0^t \| \frac{\partial v}{\partial t}(\cdot,t) \|_{L^2(\Omega)}^2 dt + \| v(\cdot, \tau) \|_{L^2(\Omega)}^2 \leq \delta_7 \left\{ \int_0^T \| \mathcal{S}_x f \|_{L^2(\Omega)}^2 dt + \| \mathcal{S}_x \psi \|_{L^2(\Omega)}^2 \right\}. \]
\[\delta_t = \delta_0 \left(1 + \frac{T^\beta}{\Gamma(1 + \beta)}\right)\]

Since the RHS of estimate (36) is independent of \(\tau\), we can take the supremum on the LHS with respect to \(\tau\) over \([0, T]\). Thus, we get the desired inequality (19). Theorem (4) proof is complete. \(\blacksquare\)

5. Existence of the linear problem solution

The current section's aim is to prove the existence of the strong solution of problems (6)–(8). It remains to demonstrate the density of the range of \(R(L)\).

**Proposition 5.** \([32]\) The operator \(L\) engendered by problems (1)–(3) has a closure.

Defining the operator equation solution

\[\mathcal{L}v = \mathcal{F} = (f, \varphi, \psi),\]

as a strong solution of problems (6)–(8). The inequality (19) can be extended into

\[\|v\|_E \leq \|\mathcal{L}v\|_F, \quad \forall v \in D(\mathcal{L}).\]  

(37)

the inequality demonstrated above assures the strong solution uniqueness.

**Corollary 6.** The range of the operator \(\mathcal{L}\) is closed in \(F\) and \(R(\mathcal{L}) = R(L)\) and \(L^{-1} = \overline{L^{-1}}\).

**Theorem 7.** Let Theorem (4) conditions be verified. Then, for any \(\mathcal{F} = (f, g, h) \in F\), the problems (6)–(8) have a unique solution \(v\) such that \(v = L^{-1} \mathcal{F} = \overline{L^{-1}} \mathcal{F}\).

**Proposition 8.** Let Assumption (1) be fulfilled. If for a certain function \(g \in L^2(Q)\), and every \(v \in D(L)\) verifying homogenous initial conditions, we have

\[(\mathcal{L}v, g)_{L^2(D)} = 0,\]

(38)

then \(g\) vanishes almost everywhere in \(D\) are as follows:

**Proof.** Introducing a new function \(\sigma(x, t)\) verifies conditions (2) and (3), and \(\sigma, \sigma_x, \mathcal{N}_1\sigma, \mathcal{N}_2\sigma\) and \(C^\delta t^{\theta+1}\sigma \in L^2(D)\), then we pose

\[v(x, t) = \mathcal{N}_1^{\sigma},\]

where

\[\mathcal{N}_1^{\sigma} = \int_0^t \sigma(x, s)ds, \quad \mathcal{N}_2^{\sigma} = \int_0^t \int_0^s \sigma(x, z)dzds.\]

Equation (38) then becomes

\[\left(\mathcal{N}_1^{\mathcal{N}_1^{\sigma}} - \frac{\partial}{\partial x} \left(\gamma(x, t)\mathcal{N}_1^{\sigma} \left(\frac{\partial \sigma}{\partial x}\right)\right) - \frac{\partial^2}{\partial x \partial t} \left(\eta(x, t)\mathcal{N}_1^{\sigma} \left(\frac{\partial \sigma}{\partial x}\right)\right) - \int_0^t \xi(t-z)\mathcal{N}_2^{\sigma}(x, z)dz, g\right)_{L^2(D)} = 0.\]  

(39)
Now, we consider the function
\[ g(x,t) = -\mathcal{F}_1 \mathcal{F}_2 \sigma. \] (40)

Obviously, the function \( g \) included in \( L^2(D) \). Equations (39)–(40) lead to
\[ \begin{align*}
-\left( C \partial_t^{\alpha+1} \mathcal{F}_1 \mathcal{F}_2 \sigma, \mathcal{F}_1 \mathcal{F}_2 \sigma \right)_{L^2(D)} + \left( \frac{\partial}{\partial x} \left( \gamma(x,t) \mathcal{F}_1 \mathcal{F}_2 \left( \frac{\partial \sigma}{\partial x} \right), \mathcal{F}_1 \mathcal{F}_2 \sigma \right) \right)_{L^2(D)} \\
+ \left( \frac{\partial}{\partial x} \frac{\partial}{\partial t} \left( \eta(x,t) \mathcal{F}_1 \mathcal{F}_2 \left( \frac{\partial \sigma}{\partial x} \right), \mathcal{F}_1 \mathcal{F}_2 \sigma \right) \right)_{L^2(D)} + \left( \int_0^t \xi(t-z) \mathcal{F}_1 \mathcal{F}_2 \sigma(x,z) dz, \mathcal{F}_1 \mathcal{F}_2 \sigma \right)_{L^2(D)} = 0
\end{align*} \] (41)

Note that the function \( \sigma \) verifies conditions (2)–(3), then we have
\[ \begin{align*}
- \left( C \partial_t^{\alpha+1} \mathcal{F}_1 \mathcal{F}_2 \sigma, \mathcal{F}_1 \mathcal{F}_2 \sigma \right)_{L^2(D)} &= - \left( C \partial_t^{\alpha+1} \mathcal{F}_1 \mathcal{F}_2 \sigma, \mathcal{F}_1 \mathcal{F}_2 \sigma \right)_{L^2(D)} \\
\left( \frac{\partial}{\partial x} \left( \gamma(x,t) \mathcal{F}_1 \mathcal{F}_2 \left( \frac{\partial \sigma}{\partial x} \right), \mathcal{F}_1 \mathcal{F}_2 \sigma \right) \right)_{L^2(D)} &= \frac{1}{2} \int_0^1 \gamma^2 \left( \mathcal{F}_1 \mathcal{F}_2 \sigma \right)^2 dx - \frac{1}{2} \int_0^t \frac{\partial \gamma}{\partial t} \left( \mathcal{F}_1 \mathcal{F}_2 \sigma \right)^2 dx dt \\
+ \left( \frac{\partial \gamma(x,t)}{\partial x} \left( \mathcal{F}_1 \mathcal{F}_2 \sigma, \mathcal{F}_1 \mathcal{F}_2 \sigma \right) \right)_{L^2(D)} \\
\left( \frac{\partial^2}{\partial x \partial t} \left( \eta(x,t) \mathcal{F}_1 \mathcal{F}_2 \left( \frac{\partial \sigma}{\partial x} \right), \mathcal{F}_1 \mathcal{F}_2 \sigma \right) \right)_{L^2(D)} &= \left( \frac{\partial^2 \eta}{\partial x \partial t} \mathcal{F}_1 \mathcal{F}_2 \sigma, \mathcal{F}_1 \mathcal{F}_2 \sigma \right)_{L^2(D)} + \left( \frac{\partial \eta}{\partial t} \mathcal{F}_1 \mathcal{F}_2 \sigma, \mathcal{F}_1 \mathcal{F}_2 \sigma \right)_{L^2(D)} \\
+ \int_D \frac{\partial^2 \eta}{\partial x^2} \mathcal{F}_1 \mathcal{F}_2 \sigma^2 dx dt + \int_D \eta \mathcal{F}_1 \mathcal{F}_2 \sigma^2 dx dt
\end{align*} \] (43)

Insertion of Equations (42)–(44) into (41), yields
\[ \begin{align*}
-2 \left( C \partial_t^\alpha \mathcal{F}_1 \mathcal{F}_2 \sigma, \mathcal{F}_1 \mathcal{F}_2 \sigma \right)_{L^2(D)} + \int_0^1 \gamma \left( \mathcal{F}_1 \mathcal{F}_2 \sigma \right)^2 dx &= \int_D \frac{\partial \gamma}{\partial t} \left( \mathcal{F}_1 \mathcal{F}_2 \sigma \right)^2 dx dt \\
-2 \int_D \frac{\partial^2 \eta}{\partial x^2} \mathcal{F}_1 \mathcal{F}_2 \sigma^2 dx dt - 2 \int_0^t \eta \mathcal{F}_1 \mathcal{F}_2 \sigma^2 dx dt - 2 \left( \frac{\partial \eta}{\partial t} \mathcal{F}_1 \mathcal{F}_2 \sigma, \mathcal{F}_1 \mathcal{F}_2 \sigma \right)_{L^2(D)} \right)_{L^2(D)} \\
-2 \left( \frac{\partial \eta}{\partial t} \mathcal{F}_1 \mathcal{F}_2 \sigma, \mathcal{F}_1 \mathcal{F}_2 \sigma \right)_{L^2(D)} - 2 \left( \int_0^1 \xi(t-z) \mathcal{F}_1 \mathcal{F}_2 \sigma(x,z) dz, \mathcal{F}_1 \mathcal{F}_2 \sigma \right)_{L^2(D)} = 0
\end{align*} \] (45)

According to Lemma 1, we bound the first term on the LHS of (45); we have
\[ 2 \left( C \partial_t^\alpha \mathcal{F}_1 \mathcal{F}_2 \sigma, \mathcal{F}_1 \mathcal{F}_2 \sigma \right)_{L^2(D)} \geq C \partial_t^\alpha \left\| \mathcal{F}_1 \mathcal{F}_2 \sigma \right\|_{L^2(D)}^2, \] (46)

Also, we bound the last three terms on the RHS of (45) utilizing inequality 17, and we then get
Eliminating the first term on the LHS of (50), using Lemma 2, with

\begin{equation}
S(\tau) = \int_0^\tau \int_0^1 \left( \frac{\partial^2 \sigma}{\partial t^2} \right) dx dt \leq \delta_8 \left( \int_D \left( \frac{\partial \sigma}{\partial t} \right)^2 dx dt + \| \mathfrak{S}_x \mathfrak{S}_t \sigma \|_{L^2(D)}^2 \right)
\end{equation}

with

\begin{equation}
\delta_8 = \frac{\max (c_2 + 2(c_2 + c_0)^2 + c_0 T^2 + \frac{c_0^2}{2c_1}, 2c_0 + \frac{\beta}{2})}{\min(1, c_0)}
\end{equation}

Similarly, by discarding the second integral on the LHS of (50) and applying (53), we obtain

\begin{equation}
D_t^{\beta-1} \| \mathfrak{S}_x \mathfrak{S}_t \sigma \|_{L^2(D)}^2 \leq \delta_8 (T \exp(T \delta_8) + 1) \| \mathfrak{S}_x \mathfrak{S}_t \sigma \|_{L^2(D)}^2
\end{equation}

by Lemma 2, with

\begin{equation}
S(\tau) = \int_0^\tau \int_0^1 \left( \frac{\partial^2 \sigma}{\partial t^2} \right) dx dt
\end{equation}

and

\begin{equation}
c \partial_t^\beta S(\tau) = D_t^{\beta-1} \| \mathfrak{S}_x \mathfrak{S}_t \sigma \|_{L^2(D)}^2, S(0) = 0,
\end{equation}

it follows that

\begin{equation}
\| \mathfrak{S}_x \mathfrak{S}_t \sigma \|_{L^2(D)}^2 \leq S(0) E_\beta (\delta_8 (T \exp(T \delta_8) + 1) \tau^\beta) + \Gamma(\beta) E_\beta (\delta_8 (T \exp(T \delta_8) + 1) \tau^\beta) D_t^\beta (0) = 0,
\end{equation}

for any \( \tau \in [0, T] \). Hence inequality (55) shows that \( g = 0 \) ae in \( D \). Continuing Theorem 7 proof, we assume that for a certain function \( G = (g, g_0, g_1) \in R(L)^+ \), we have
AJMS
29,2

\((LV, g)_{L^2(D)} + (l_1 v, g_0)_{L^2(\Omega)} + (l_2 v, g_1)_{L^2(\Omega)} = 0, \) (56)

then we should show that \(g_0 = 0, g_1 = 0.\) Putting \(v \in D(L),\) verifying homogenous initial conditions into (56), yields

\[(LV, g)_{L^2(D)} = 0, \forall v \in D(L), \] (57)

By applying Proposition (8) to (57), we see that \(g = 0.\) Consequently, (56) becomes

\[(l_1 v, g_0)_{L^2(\Omega)} + (l_2 v, g_1)_{L^2(\Omega)} = 0 \forall v \in D(L), \] (58)

Since \(l_1 v\) and \(l_2 v\) are independent and their ranges \(l_1\) and \(l_2\) are everywhere dense in \(L^2(\Omega),\) we conclude that \(g_0 = g_1 = 0,\) this complete the proof of Theorem 7. \(\blacksquare\)

6. The study of the nonlinear problem

This section is devoted to solving the main problems (1)–(3). Consider now the auxiliary problem with the homogenous equation:

\[LV = \frac{c}{\alpha^2} \frac{d^{\alpha+1}}{dx} V - \frac{d}{dx} \left( \gamma(x, t) \frac{dV}{dx} \right) - \frac{d^2}{dx \partial t} \left( \eta(x, t) \frac{dV}{dx} \right) - \int_0^t \xi(t - z) V(x, z) dz = 0 \] (59)

\[\ell_1 V = V(x, 0) = 0, \quad \ell_2 V = \frac{dV(x, 0)}{dt} = 0, \quad x \in \Omega, \] (60)

\[\int_0^1 V(x, t) dx = 0, \quad V_x(1, t) = 0, \quad t \in (0, T), \] (61)

If \(V\) and \(v\) are solutions of problems (8)-(6),(1)-(3), respectively, then \(h = v - V\) satisfies

\[h = \frac{c}{\alpha^2} \frac{d^{\alpha+1} h}{dx} - \frac{d}{dx} \left( \gamma(x, t) \frac{dh}{dx} \right) - \frac{d^2}{dx \partial t} \left( \eta(x, t) \frac{dh}{dx} \right) - \int_0^t \xi(t - z) h(x, z) dz \] (62)

\[\ell_1 h = h(x, 0) = 0, \quad \ell_2 h = \frac{d}{dt} (x, 0) = 0, \quad x \in \Omega, \] (63)

\[h(1, t) = 0, \quad t \in (0, T), \] (64)

such that the function \(G\left(x, t, h, \frac{d}{dx} h\right) = f \left( x, t, h + V, \frac{d}{dx} v + \frac{d}{dx} V \right),\) verifies the following condition

\[|G(x, t, w_1, y_1) - G(x, t, w_2, y_2)| \leq L(|w_1 - w_2| + |y_1 - y_2|) \quad \text{for all } (x, t) \in D. \] (65)

Theorem 7 shows that the solution of problems (6)–(8) is unique and depends continuously on the initial data. It remains to establish a similar proof for problems (62)–(64). We introduce the space
\[ \mathcal{C}^1(D) = \left\{ w \in \mathcal{C}^1(D) \text{ such that } \frac{\partial w^2}{\partial t \partial x} \in \mathcal{C}(D) \right\} \] (66)

Suppose that \( h \) and \( u \in \mathcal{C}^1(D) \) verify homogenous initial and boundary conditions \( h(x, T) = 0, h(x, 0) = 0, \int_0^1 w(x, t)dx = 0 \). For \( u \in \mathcal{C}^1(D) \), we have

\[
\left( \mathcal{L} h, \mathcal{S}_x u \right)_{L^2(D)} = \left( C \partial_t^{\beta+1} h, \mathcal{S}_x u \right)_{L^2(D)} - \left( \frac{\partial}{\partial x} \left( \gamma(x, t) \frac{\partial h}{\partial x} \right), \mathcal{S}_x u \right)_{L^2(D)} \\
- \left( \frac{\partial^2}{\partial x \partial t} \left( \eta(x, t) \frac{\partial h}{\partial x} \right), \mathcal{S}_x u \right)_{L^2(D)} - \left( \int_0^t \xi(t-z)h(x,z)dz, \mathcal{S}_x u \right)_{L^2(D)}
\] (67)

Computation of all terms of Equation (67), using conditions on \( h \) and \( u \), gives

\[
\left( C \partial_t^{\beta+1} h, \mathcal{S}_x u \right)_{L^2(D)} = -\left( C \partial_t^{\beta+1} \mathcal{S}_x h, u \right)_{L^2(D)}
\] (68)

\[
- \left( \frac{\partial}{\partial x} \left( \gamma x \frac{\partial h}{\partial x} \right), \mathcal{S}_x u \right)_{L^2(D)} = \left( \frac{\partial}{\partial t} \left( \gamma x \frac{\partial h}{\partial x} \right), u \right)_{L^2(D)}
\] (69)

\[
- \left( \frac{\partial^2}{\partial x \partial t} \left( \eta x \frac{\partial h}{\partial x} \right), \mathcal{S}_x u \right)_{L^2(D)} = \left( \frac{\partial}{\partial t} \left( \eta x \frac{\partial h}{\partial x} \right), u \right)_{L^2(D)}
\] (70)

\[
- \left( \int_0^t \xi(t-z)h(x,z)dz, \mathcal{S}_x u \right)_{L^2(D)} = \left( \int_0^t \xi(t-z)\mathcal{S}_x h(x,z)dz, u \right)_{L^2(D)}
\] (71)

Insertion of (68)–(71) into (67) yields

\[
R(h, u) = (\mathcal{S} h, G)_{L^2(D)}
\] (72)

such that

\[
R(h, u) = -\left( C \partial_t^{\beta+1} \mathcal{S}_x h, u \right)_{L^2(D)} + \left( \frac{\partial}{\partial x} \left( \gamma \frac{\partial h}{\partial x} \right), u \right)_{L^2(D)} + \left( \frac{\partial}{\partial t} \left( \eta \frac{\partial h}{\partial x} \right), u \right)_{L^2(D)} + \left( \int_0^t \xi(t-z)\mathcal{S}_x h(x,z)dz, u \right)_{L^2(D)}
\] (73)

**Definition 9.** A function \( h \in L^2(0, T, H^1(\Omega)) \) is considered as the problems (62)–(64) weak solution if it satisfies (64) and (72) holds.

Constructing an iteration sequence as follows: let \( h(0) = 0 \), and let defining the sequence \((h^{(n)})_n \in \mathbb{N} \) as follows: if \( h^{(\alpha-1)} \) is given, then for \( n \in \mathbb{N} \) solve the following problem:

\[
\mathcal{L} h = C \partial_t^{\beta+1} h^{(n)} - \frac{\partial}{\partial x} \left( \gamma \frac{\partial h^{(n)}}{\partial x} \right) - \frac{\partial^2}{\partial x \partial t} \left( \eta \frac{\partial h^{(n)}}{\partial x} \right) - \int_0^t \xi(t-z)h^{(n)}(x,z)dz \\
= G \left( x, t, h^{(\alpha-1)} \frac{\partial h^{(\alpha-1)}}{\partial x} \right)
\] (74)
\[ \ell_1 h^{(n)} = h^{(n)}(x, 0) = 0, \quad \ell_2 h^{(n)} = \frac{\partial h^{(n)}}{\partial t}(x, 0) = 0, \quad x \in \Omega, \quad (75) \]
\[ \int_0^1 h^{(n)}(x, t)dx = 0, \quad h_z^{(n)}(1, t) = 0, \quad t \in (0, T), \quad (76) \]

**Theorem 10.** For each fixed \( n \), assume that the solution of problems (74)–(76) \( h^{(n)}(x, t) \) is unique. If we put \( H^{(n)}(x, t) = h^{(n+1)}(x, t) - h^{(n)}(x, t) \), then we obtain
\[
\mathcal{L}H^{(n)} = C_{t}^{\beta+1}H^{(n)} - \frac{\partial}{\partial x} \left( \gamma \frac{\partial H^{(n)}}{\partial x} \right) - \frac{\partial^2}{\partial x \partial t} \left( \eta \frac{\partial H^{(n)}}{\partial x} \right) - \int_0^1 \xi(t - z)H^{(n)}(x, z)dz
\]
\[ = \Psi^{(n-1)}(x, t) \quad (77) \]
\[ \ell_1 H^{(n)} = H^{(n)}(x, 0) = 0, \quad \ell_2 H^{(n)} = \frac{\partial H^{(n)}}{\partial t}(x, 0) = 0, \quad x \in \Omega, \quad (78) \]
\[ \int_0^1 H^{(n)}(x, t)dx = 0, \quad H_z^{(n)}(1, t) = 0, \quad t \in (0, T), \quad (79) \]

with
\[ \Psi^{(n-1)}(x, t) = G \left( x, t, h^{(n)}, \frac{\partial h^{(n)}}{\partial x} \right) - G \left( x, t, h^{(n-1)}, \frac{\partial h^{(n-1)}}{\partial x} \right) \]

**Lemma 11.** Under Assumptions (1), and supposing that the condition (65) holds, then for the linearized problems (77)–(79), the following estimate holds
\[ \|H^{(n)}\|_{L^2(0, T; H^1(\Omega))} \leq K \|H^{(n-1)}\|_{L^2(0, T; H^1(\Omega))} \quad (80) \]

where \( K > 0 \) is constant given by
\[ K = \exp \left( \delta_0 T \right) \left( 1 + \Gamma(\beta)E_{\psi, \beta}(\delta_0 \exp \left( \delta_0 T \right) t^\beta) \frac{T^\delta}{\Gamma(1 + \beta)} \right) \]

**Proof.** We take the scalar product in \( L^2(D^\tau), \tau \in [0, T] \) of (77) and the integro-differential operator \( MH^{(n)} = -\Delta^2 h^{(n)} \), we get
\[ 2 \left( C_{t}^{\beta+1}H^{(n)}, -\Delta^2 h^{(n)} \right)_{L^2(D^\tau)} - 2 \left( \frac{\partial}{\partial x} \left( \gamma(x, t) \frac{\partial H^{(n)}}{\partial x} \right), -\Delta^2 h^{(n)} \right)_{L^2(D^\tau)} - 2 \left( \frac{\partial^2}{\partial x \partial t} \left( \eta(x, t) \frac{\partial H^{(n)}}{\partial x} \right), -\Delta^2 h^{(n)} \right)_{L^2(D^\tau)} - 2 \left( \int_0^1 \xi(t - z)H^{(n)}(x, z)dz, -\Delta^2 h^{(n)} \right)_{L^2(D^\tau)} = 2 \left( \Psi^{(n-1)}(x, t), -\Delta^2 h^{(n)} \right)_{L^2(D^\tau)}. \quad (81) \]
Integrations by parts all terms of (81), by using conditions (78)—(79), proceeding as in the establishment of Theorem 4, yields

\[
D_t^{\alpha-1}\|\mathfrak{S}_x \frac{\partial H^{(n)}}{\partial t} \|_{L^2(\Omega)}^2 + (c_0 + c_5) \| \mathfrak{S}_x H^{(n)}(.,\tau) \|_{L^2(\Omega)}^2 \leq \int_0^\tau \| \mathfrak{S}_x \Psi^{(n-1)}(x,t) \|_{L^2(\Omega)}^2 dt
\]

(82)

On the other hand, applying to Equation (77) the operator \( \mathfrak{S}_x \) and taking into consideration condition (79), multiplying the resulting equation with \( \int \eta \theta \) and integrating over \( D_t^\alpha \), we get

\[
\int_{D_t^\alpha} c D_t^{\beta-1} \mathfrak{S}_x H^{(n)} \frac{\partial H^{(n)}}{\partial x} dx dt - \int_{D_t^\alpha} \gamma(x,t) \left( \frac{\partial H^{(n)}}{\partial x} \right)^2 dx dt - \int_{D_t^\alpha} \frac{\partial}{\partial t} \left( \eta(x,t) \frac{\partial H^{(n)}}{\partial x} \right) \frac{\partial H^{(n)}}{\partial x} dx dt
\]

\[- \int_{D_t^\alpha} \int_0^\tau \xi(t-z) \frac{\partial H^{(n)}}{\partial x}(x,z) dx dt = \int_{D_t^\alpha} \mathfrak{S}_x \Psi^{(n-1)}(x,t) \frac{\partial H^{(n)}}{\partial x} dx dt
\]

(83)

After integration by parts of all the terms of (83) and taking into consideration conditions (78), (79) and using inequality (17), we have

\[
\int_{D_t^\alpha} c D_t^{\beta-1} H^{(n)} H^{(n)} dx dt + c_0 \int_0^\tau \| \frac{\partial H^{(n)}}{\partial x}(-.,\tau) \|_{L^2(\Omega)}^2 + \frac{1}{2} \| \frac{\partial H^{(n)}}{\partial x}(-.,\tau) \|_{L^2(\Omega)}^2
\]

(84)

Combination of inequalities (83)–(84) gives

\[
D_t^{\alpha-1}\|\mathfrak{S}_x \frac{\partial H^{(n)}}{\partial t} \|_{L^2(\Omega)} + \int_0^\tau \| \mathfrak{S}_x \frac{\partial H^{(n)}}{\partial t} \|_{L^2(\Omega)} dt + c_0 \int_0^\tau \| \mathfrak{S}_x H^{(n)}(.,\tau) \|_{L^2(\Omega)} dt + \frac{1}{2} \| \frac{\partial H^{(n)}}{\partial x}(-.,\tau) \|_{L^2(\Omega)}^2
\]

\[+ (c_0 + c_5) \| H^{(n)}(.,\tau) \|_{L^2(\Omega)} \leq \int_0^\tau \| \Psi^{(n-1)} \|_{L^2(\Omega)}^2 dt + \left( \frac{5}{2} + C_2 \right) \int_0^\tau \| \mathfrak{S}_x \frac{\partial H^{(n)}}{\partial t}(-.,\tau) \|_{L^2(\Omega)}^2 dt
\]

\[+ (2(c_2^2 + c_3^2) + c_2 + c_5 + c_6 T^2 + 1) \int_0^\tau \| H^{(n)}(.,\tau) \|_{L^2(\Omega)}^2 dt
\]

(85)

Eliminating the last term on the RHS of (85), by using Gronwall’s lemma, it comes
Then use the Gronwall's lemma to discard the last integral on the R.H.S of inequality (86), we drop the three first elements then use the Gronwall's lemma, it follows

\[ \int_0^\tau \| \mathcal{S}_x \frac{\partial H^{(n)}}{\partial t} \|_{L^2(\Omega)}^2 dt \leq \Gamma(\beta) \| E_{\beta,\beta} \mathcal{S}_x \mathcal{S}_x \mathcal{S}_x \|_{L^2(\Omega)}^2 \] (87)

On the other hand, via the condition (65), we get

\[ \int_0^\tau \| \Psi^{(n-1)} \|_{L^2(\Omega)}^2 dt \leq 2T_2 \int_0^\tau \left( \| H^{(n-1)}(.,t) \|_{L^2(\Omega)}^2 + \frac{\| \partial H^{(n-1)}(.,t) \|_{L^2(\Omega)}^2}{\| \partial H^{(n)}(.,t) \|_{L^2(\Omega)}^2} \right) dt \] (88)

Combining (86)–(88) and by using (35), we get

\[ D^{\beta-1} \| \mathcal{S}_x \frac{\partial H^{(n)}}{\partial t} \|_{L^2(\Omega)}^2 + \int_0^\tau \| \partial^{\beta+1} H^{(n)} \|_{L^2(\Omega)}^2 dt + \int_0^\tau \| \partial H^{(n)} \|_{L^2(\Omega)}^2 dt + \| H^{(n)}(.,t) \|_{L^2(\Omega)}^2 \leq \delta_1 L^2 \int_0^\tau \left( \| H^{(n-1)}(.,t) \|_{L^2(\Omega)}^2 + \| \partial H^{(n-1)}(.,t) \|_{L^2(\Omega)}^2 \right) dt \] (89)

where

\[ \delta_1 = \exp(\delta_0 T) \left( 1 + \Gamma(\beta) \| E_{\beta,\beta} \mathcal{S}_x \mathcal{S}_x \mathcal{S}_x \|_{L^2(\Omega)}^2 \right) \] (90)

After discarding the first two terms on the L.H.S of inequality (89), we get

\[ \int_0^\tau \| \frac{\partial H^{(n)}}{\partial x} \|_{L^2(\Omega)}^2 dt + \| H^{(n)}(.,t) \|_{L^2(\Omega)}^2 + \| \frac{\partial H^{(n)}}{\partial x} \|_{L^2(\Omega)}^2 \frac{T^\beta}{\Gamma(1+\beta)} \leq \delta_1 L^2 \int_0^T \left( \| H^{(n-1)}(.,t) \|_{L^2(\Omega)}^2 + \| \frac{\partial H^{(n-1)}}{\partial x} \|_{L^2(\Omega)}^2 \right) dt \] (91)

Here, the R.H.S doesn't depend on \( \tau \) so, we can replace the L.H.S by upper bounds with respect to \( \tau \), we obtain
\[
\int_0^T \left\| \frac{\partial H^{(n)}}{\partial x} (.,t) \right\|_{L^2(\Omega)}^2 dt + \left\| H^{(n)} (.,\tau) \right\|_{L^2(\Omega)}^2 + \left\| \frac{\partial H^{(n)}}{\partial x} (.,\tau) \right\|_{L^2(\Omega)}^2 dt \\
\leq 4 \delta_1 L^2 \int_0^T \left( \left\| H^{(n-1)} (.,t) \right\|_{L^2(\Omega)}^2 + \left\| \frac{\partial H^{(n-1)}}{\partial x} (.,t) \right\|_{L^2(\Omega)}^2 \right) dt 
\]

Now, we integrate over \((0, T)\), we get
\[
\int_0^T \left\| H^{(n)} (.,t) \right\|_{L^2(\Omega)}^2 dt + \int_0^T \left\| \frac{\partial H^{(n)}}{\partial x} (.,t) \right\|_{L^2(\Omega)}^2 dt \\
\leq 4 \delta_2 L^2 \int_0^T \left( \left\| H^{(n-1)} (.,t) \right\|_{L^2(\Omega)}^2 + \left\| \frac{\partial H^{(n-1)}}{\partial x} (.,t) \right\|_{L^2(\Omega)}^2 \right) dt \\
\delta_2 = \frac{4 \delta_1 L^2 T}{\ln(1, T)}
\]

We get then the desired inequality (80).
\[
\left\| H^{(n)} \right\|_{L^2(0, T,H^1(\Omega))} \leq 4 \delta_2 \left\| H^{(n-1)} \right\|_{L(0, T,H^1(\Omega))} 
\]

Using the convergence of series criteria we conclude that \(\sum_{n=1}^\infty H^{(n)}\) converges if \(4 \delta_1 L^2 T / \ln(1, T) < 1\), namely if \(L < \sqrt{\frac{\ln(1, T)}{4 \delta_1 T}}\). Since \(H^{(n)}(x,t) = H^{(n-1)}(x,t) - h^{(n)}(x,t)\), then the sequence \((h^{(n)})_{n \in \mathbb{N}}\) given by \(h^{(n)}(x,t) = \sum_{i=0}^{n-1} H^{(i)} + h^{(0)}(x,t)\), \(i \in \mathbb{N}\) converges to a function \(h \in L^2((0, T), H^1(0, 1))\). In order to show that this limit is the solution of problems (77)–(79), it is sufficient to demonstrate that \(h\) verifies (64) and (72).

We have, from problems (74)–(76), that
\[
R\left(h^{(n)}, u\right) = \left( u, \mathcal{S}_x G\left( x, t, h^{(n-1)}, \frac{\partial h^{(n-1)}}{\partial x} \right) \right)_{L^2(D)} 
\]

Precisely
\[
R\left(h^{(n)} - h, u\right) + R(h, u) = \left( u, \mathcal{S}_x G\left( x, t, h^{(n-1)}, \frac{\partial h^{(n-1)}}{\partial x} \right) - \mathcal{S}_x G\left( x, t, h, \frac{\partial h}{\partial x} \right) \right)_{L^2(D)} \\
+ \left( u, \mathcal{S}_x G\left( x, t, h, \frac{\partial h}{\partial x} \right) \right)_{L^2(D)} 
\]

using Equation (74), then (95) becomes
\[
R\left(h^{(n)} - h, u\right) = -\left( x^{n+1} \mathcal{S}_x (h^{(n)} - h), u \right)_{L^2(D)} + \left( \frac{\partial (h^{(n)} - h)}{\partial x}, u \right)_{L^2(D)} \\
+ \left( \frac{\partial}{\partial t} \left( \eta - \frac{\partial (h^{(n)} - h)}{\partial x} \right), u \right)_{L^2(D)} + \left( \int_0^t \xi(t - z) \mathcal{S}_x (h^{(n)} - h)(x,z) dz, u \right)_{L^2(D)} 
\]
By integrating the parts on all terms on the LHS, and taking into consideration conditions on $v$ and $w$, (96) transforms into

$$R(h^{(n)} - h, u) = \left( c \delta_i^{\theta + 1} (h^{(n)} - h), \mathcal{S}_x u \right)_{L^2(D)} + \left( \left( \frac{\partial (h^{(n)} - h)}{\partial x} \right), u \right)_{L^2(D)}$$

$$+ \left( \eta \frac{\partial (h^{(n)} - h)}{\partial x}, \frac{\partial u}{\partial t} \right)_{L^2(D)} + \left( \int_0^1 \xi(t-z) \mathcal{S}_x (h^{(n)} - h)(x,z)dz, u \right)_{L^2(D)}$$

Applying Cauchy-Schwartz inequality yields

$$R(h^{(n)} - h, u) \leq \delta_{13} \|h^{(n)} - h\|_{L^2(0,T;H^1(\Omega))} \left( \| u \|_{L^2(D)} + \| \frac{\partial u}{\partial t} \|_{L^2(D)} \right)$$

where

$$\delta_{13} = \max \left( c_1 + T \frac{c_0}{2}, c_6 \right)$$

and from (95) we have the following estimate

$$\left( u, \mathcal{S}_x G \left( x, t, h^{(n)}, \frac{\partial h^{(n-1)}}{\partial x} \right) - \mathcal{S}_x G \left( x, t, h, \frac{\partial h}{\partial x} \right) \right)_{L^2(D)} \leq \frac{L}{\sqrt{2}} \|h^{(n)} - h\|_{L^2(0,T;H^1(\Omega))}$$

$$\| u \|_{L^2(D)}$$

Passing to the limit $n \to \infty$ in (97), and taking into consideration (98)-(99), we obtain

$$R(h, u) = \left( u, \mathcal{S}_x G \left( x, t, h, \frac{\partial h}{\partial x} \right) \right)_{L^2(D)}$$

To conclude that problems (77)–(79) admit a weak solution, we prove that (64) holds. Since $\lim_{n \to \infty} \|h^{(n)} - h\|_{L^2(0,T;H^1(\Omega))} = 0$ then, we deduce that $\int_0^1 h dx = 0$ and $\frac{\partial h}{\partial x}(1,t) = 0$.

Therefore, we have established this result:

**Theorem 12.** Suppose that conditions of Lemma (11) hold, and that $L < \sqrt{\min(1,T)}$, then the problems (62)–(64) admit a weak solution in $L^2(0, T, H^1(\Omega))$.

Now, we prove the uniqueness of problems (62)–(64).

**Theorem 13.** Under conditions of Lemma (11), the problems (62)–(64) admits unique solutions.

**Proof.** Suppose that the problems (62)–(64) admit $v_1$ and $v_2$ as solutions in $L^2(0, T, H^1(\Omega))$, then $H = v_1 - v_2$ belongs to $L^2(0, T, H^1(\Omega))$ and verifies

$$\mathcal{L}H = c \delta_i^{\theta + 1} H - \frac{\partial}{\partial x} \left( \gamma(x, t) \frac{\partial H}{\partial x} \right) - \frac{\partial^2}{\partial x \partial t} \left( \eta(x, t) \frac{\partial H}{\partial x} \right) - \int_0^1 \xi(t-z) H(x,z)dz = \Psi(x,t)$$

$$\ell_1 H = H(x,0) = 0, \quad \ell_2 H = H_t(x,0) = 0, \quad x \in \Omega,$$

$$\int_0^1 H(x,t) dx = 0, \quad H_t(1,t) = 0, \quad t \in (0, T),$$

where $\Psi(x,t) = G(x, t, v_1, \frac{\partial v_1}{\partial x}) - G(x, t, v_2, \frac{\partial v_2}{\partial x})$. 

$$\ell_1 H = H(x,0) = 0, \quad \ell_2 H = H_t(x,0) = 0, \quad x \in \Omega,$$
This will be done by establishing the same proof of Lemma 11; we obtain
\[ \|H\|_{L^2(0, T; H^1(\Omega))} \leq K \|H\|_{L^2(0, T; H^1(\Omega))} \]  
(104)

Since \( K < 1 \), then from (80) we have \((1-K)\|H\|_{L^2(0, T; H^1(\Omega))}\leq 0\), from which we deduce that \( v_1 = v_2 \in L^2((0, T), H^1(\Omega)) \). ■
